

Easy Logic

A revolutionary technology for custom programming of Galileosky tracking devices

Easy Logic

An exclusive technology inside all Galileosky devices for custom programming. Help your customers increase business efficiency with the state-of-art technology. Easy Logic is easy to use, full packed of features, and designed to harness data from the connected devices and make them work.

Easy interface to develop solution on your own

Create drag-and-drop algorithm in a few steps

Use presets or set your reactions to events

Use cases

Notify the driver about violations to correct the driving style in real time

Start car engine automatically when the air temperature drops down

Enable safe vehicle engine blocking in case of undesirable driver actions

Sustain temperature and humidity regimes automatically

Predict pumps, generators, and other special machinery faults before they occur

Automate equipment and facilities performance according to sensors data

Make new additional devices integration over serial ports

Send an SMS about fuel drains to the dispatcher

[And much more](#)

Advantages

Easy for everyone

Whether you're starting out or already a pro, Easy Logic makes it simple to create algorithms. Just drag-and-drop blocks and connect them.

Integrate new peripheral by yourself.

Require specific peripheral for the project? Not a problem! Connect new sensors, controllers and other devices by yourself.

Go beyond the standard solutions

Consider Easy Logic as your competitive tool. Offer your client more than just fleet monitoring – business automation, processes optimization and human factor mistakes prevention.

How it works

Set your own algorithm of actions for each Galileosky GPS device in case of certain events

- 1 Create an algorithm
- 2 Make the device react to events
- 3 Choose ready-to-use algorithms or create your own
